

Abstract

The invention relates to a device for removing and smearing cells for a cytological examination with a handle at whose front end a device for the collection of the cells is arranged. The object of the invention is to provide a device that overcomes the disadvantages of the prior art and provides an economical solution for cell collection and a reliable solution for smearing on a microscope slide. This object is attained in that device (2) is embodied as a cone tapering towards the front in which a stabilizing device (23) acting on a longitudinal extension of the cone is arranged.
